feeding a Fischer-Tropsch derived paraffinic hydrocarbon feedstock comprising heavy paraffinic hydrocarbons and, optionally, light paraffinic hydrocarbons, medium paraffinic hydrocarbons or a mixture thereof, into a distillation column;

operating the distillation column to produce usable wax products; and withdrawing from the distillation column an overhead stream, a bottom stream comprising usable wax products, and at least one side stream comprising usable wax products.

- 2. (amended) A process according to Claim 1, wherein the Fischer-Tropsch derived paraffinic hydrocarbon feedstock comprises, in addition to the heavy paraffinic hydrocarbons [and] which comprise hydrocarbon molecules with carbon numbers or carbon atoms in the range C_{15} and greater, the medium paraffinic hydrocarbons comprising hydrocarbon molecules with carbon numbers in the range C_{10} to C_{80} and the light paraffinic hydrocarbons comprising hydrocarbon molecules with carbon numbers in the range C_{35} and less.
- 8. (Twice amended) A process according to Claim 1, wherein the distillation column contains structured packing as a distillation medium, with the structured packing having a surface area, in m², to volume, in m³, ratio of 125:1 to 750:1.

9. (amended) A process according to Claim 8, wherein a plurality of the side streams are provided, with the distillation column including a draw point or zone for each of the side streams as well as for the overhead and bottom streams, and with a plurality of distillation stages being provided in the distillation column, with each stage comprising the structured packing.
